

QPM2239

13 – 15.5GHz 80W GaN Power Amplifier Module

Product Overview

Qorvo's QPM2239 is a packaged, high-power Ku-band amplifier module, fabricated on Qorvo's production 0.25 μm GaN on SiC process (QGaN25). Covering 13–15.5 GHz, the QPM2239 provides 80 W of saturated output power and 29 dB of small-signal gain while achieving > 25% power-added efficiency.

The QPM2239 is packaged in a 10-lead 19.05 x 19.05 mm bolt-down package with a Cu base for superior thermal management. It can support a variety of operating conditions to best support system requirements. With good thermal properties, it can support a range of bias voltages and will perform well under CW operation.

The QPM2239 has DC blocking capacitors on both RF ports, which are matched to 50 ohms.

The QPM2239 is ideal for supporting communications and radar applications in both commercial and military markets

4. Adjust V_G more positive until $I_{DQ} = 800\text{ mA}$,
 $V_G \sim -2.5\text{ V} \pm 0.5\text{ V}$ typical
5. Apply RF signal

Bias-Down Procedure

1. Turn off RF signal
2. Reduce V_G to -5.0 V. Ensure $I_{DQ} \sim 0\text{mA}$
4. Set V_D to 0 V
5. Turn off V_D supply
6. Turn off V_G supply

Assembly Notes

1. Carefully clean the PC board and package leads with alcohol. Allow it to dry fully.
2. To improve the thermal and RF performance, Qorvo recommends attaching a heat sink to the bottom of the PCB and apply thermal compound (Arctic Silver 5 recommended) or 4 mil indium shim between the heat sink and the package.
3. (The following is for *information only*. There are many variables in a second level assembly that Qorvo does not control, so Qorvo does not recommend an absolute torque value.) Use screws to attach the component to the heat sink. A suggested torque value is 16 in-oz. for a 0-80 screw. Start with screws finger tight, then torque to 8 in-oz., then torque to final value. Use the following tightening pattern:

4. Apply no-flux solder to each pin of the QPA3055P. The component leads should be manually soldered, and the package should not be subjected to conventional reflow processes. The use of no-clean solder to avoid washing after soldering is recommended.

Solderability

- The component leads should be manually soldered, and the package cannot be subjected to conventional reflow processes.
- Soldering of the component leads is compatible with the latest version of J-STD-020, lead-free solder, 260 °C
- The use of no-clean solder to avoid washing after soldering is recommended
