General Description

The HMC1095LP4E is a broadband 6-bit GaAs IC Digital Attenuator in a low cost leadless SMT package. This versatile digital attenuator incorporates off-chip AC ground capacitors for near DC operation, making it suitable for a wide variety of RF and IF applications. The dual mode control interface is CMOS/TTL compatible, and accepts either a three wire serial input or a 6 bit parallel word. The HMC1095LP4E also features a user selectable power up state and a serial output port for cascading other Hittite serial controlled components. The HMC1095LP4E is housed in a RoHS compliant 4x4 mm QFN leadless package, and requires no external matching components.

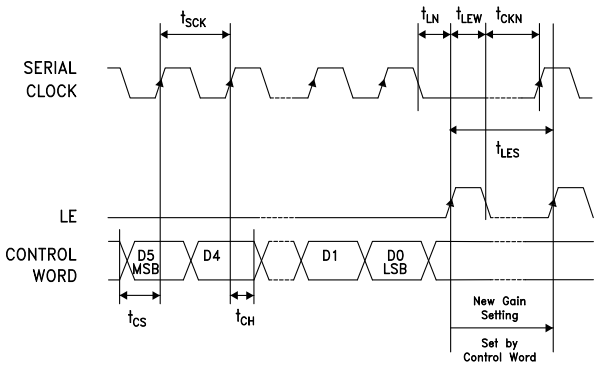
Serial Control Interface

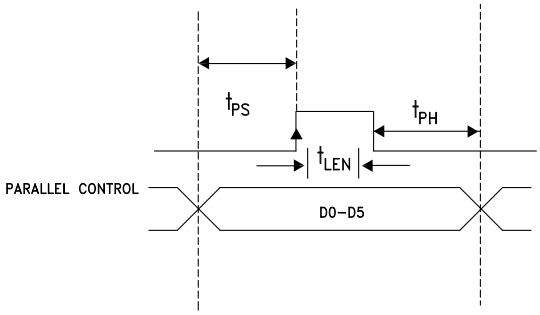
The HMC1095LP4E contains a 3-wire SPI compatible digital interface (SERIN, CLK, LE). The serial control interface is activated when P/S is kept high. The 6-bit serial word must be loaded MSB first. The positive-edge sensitive CLK and LE requires clean transitions. If mechanical switches are used, sufficient debouncing should be provided. When LE is high, 6-bit data in the serial input register is transferred to the attenuator. When LE is high CLK is masked to prevent data transition during output loading.

When P/S is low, 3-wire SPI interface inputs (SERIN, CLK, LE) are disabled and the input register is loaded with parallel digital inputs (D0-D5). When LE is high, 6-bit parallel data changes the state of the part per truth table.

For all modes of operations, the state will stay constant while LE is kept low.



Timing Diagram *(Latched Parallel Mode)*



Parameter	Min. [1]	Typ. [1]
Min. serial period, t_{SCK}	70 ns	
Control set-up time, t_{CS}	15 ns	
Control hold-time, t_{CH}		20 ns
LE setup-time, t_{LN}	15 ns	
Min. LE pulse width, t_{LEW}		10 ns
Min LE pulse spacing, t_{LES}		630 ns
Serial clock hold-time from LE, t_{CKN}		10 ns
Hold Time, $t_{PH.}$		0 ns
Latch Enable Minimum Width, t_{LEN}		10 ns
Setup Time, t_{PS}		2 ns

Parallel Mode

(Direct Parallel Mode & Latched Parallel Mode)

Note: The parallel mode is enabled when P/S is set to low.

Direct Parallel Mode - The attenuation state is changed by the control voltage inputs D0-D5 directly. The LE (Latch Enable) must be at a logic high at all times to control the attenuator in this manner.

Latched Parallel Mode - The attenuation state is selected using the control voltage inputs D0-D5 and set while the LE is in the Low state. The attenuator will not change state while LE is Low. Once all Control Voltage Inputs are at the desired states the LE is pulsed. See timing diagram above for reference.

Power-Up States

If LE is set to logic LOW at power-up, the logic state of PUP1 and PUP2 determines the power-up state of the part per PUP truth table. If the LE is set to logic HIGH at power-up, the logic state of D0-D5 determines the power-up state of the part per truth table. The attenuator latches in the desired power-up state approximately 200 ms after power-up.

Power-On Sequence

The ideal power-up sequence is: GND, VDD, digital inputs, RF inputs. The relative order of the digital inputs are not important as long as they are powered after VDD / GND

Bias Voltage

VDD (V)	Idd (Typ.) (mA)
5	2.0

Control Voltage Table

State	Vdd = +5V
Low	0 to 0.8V @ <1 µA

0	1	0	-24
0	0	1	-16

Note: The logic state of D0 - D5 determines the power-up state per truth table shown below when LE is high at power-up.

Low	High	High	High	High	High	-16 dB
Low	Low	Low	Low	Low	Low	-31.5 dB

Any combination of the above states will provide an attenuation equal to the sum of the bits selected.

[2] Circuit Board Material: Arlon 25FR

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 75 Ohms impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
