

OPA1622 SoundPlus™ 高保真、双极输入音频运算放大器

1 特性

- 高保真音质
- 超低噪声：1kHz 时为 $2.8nV/\sqrt{Hz}$
- 超低总谐波失真 + 噪声 (THD+N)：-119dB (142mW/通道至 32Ω/通道)
- 宽增益带宽产品：32MHz (G = +1000)
- 高转换率：10V/μs
- 高容性负载驱动能力：> 600pF
- 高开环增益：136dB (600Ω 负载)
- 低静态电流：每通道 2.6mA
- 可降低喀哒和噼啪噪声的低功耗关断模式：每通道 5μA
- 短路保护
- 宽电源电压范围：±2V 至 ±18V
- 采用小型超薄小外形尺寸无引线 (VSON)-10 封装

2 应用

- 高保真 (HiFi) 耳机驱动器
- 专业音频设备
- 模数混合控制台
- 音频测试和测量
- 高端 蓝光碟™ 播放器
- 高端影音 (A/V) 接收器

3 说明

OPA1622 是一款双通道、双极输入、SoundPlus™ 音频运算放大器。该器件在 1kHz 频率下拥有 $2.8nV/\sqrt{Hz}$ 的超低噪声密度和 -119.2dB 的超低 THD+N，同时还能够以 100mW 的输出功率驱动一个 32Ω 负载。OPA1622 具有极高的交流电源抑制比 (PSRR) 和共模抑制比 (CMRR) 技术规格，可消除来自电源的噪声，因此非常适合便携音频应用。此外，该器件还具有 +145mA/-130mA 的高输出驱动能力。

OPA1622 支持 ±2V 到 ±18V 的宽电源电压范围，每通道电源电流仅为 2.6mA。OPA1622 运算放大器的单位增益稳定，在宽范围负载条件下可保持出色的动态性能。OPA1622 具有关断模式，允许放大器从正常运行状态切换至一个待机电流典型值低于 5μA 的状态。此关断特性专门用于消除进入或退出关断模式时的喀哒和噼啪噪声。

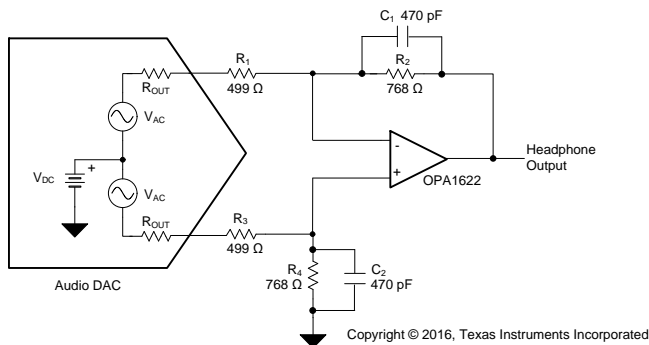

OPA1622 内部采用独特布局，即使在过驱或过载条件下也可在通道间实现最低串扰和零交互。此器件的额定温度介于 -40°C 至 +125°C 之间。

器件信息⁽¹⁾

| 器件型号 | 封装 | 封装尺寸 (标称值) |
|---------|-----------|-----------------|
| OPA1622 | VSON (10) | 3.00mm x 3.00mm |

(1) 要了解所有可用封装，请参见数据表末尾的封装选项附录。

OPA1622 应用于高保真耳机驱动器

快速傅立叶变换 (FFT): 1kHz、32Ω 负载、50mW

| V+ | 2 | — | Positive (highest) power supply |
| V- | 4 | — | Negative (lowest) power supply |
| Thermal pad | | | Exposed thermal die pad on underside; connect thermal die pad to V-. Soldering the thermal pad improves heat dissipation and provides specified performance. |

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|-------------|---|--------------|--------------|------|
| Voltage | Supply voltage, $V_S = (V+) - (V-)$ | 40 | | V |
| | Input voltage (signal inputs, enable, ground) | $(V-) - 0.5$ | $(V+) + 0.5$ | |
| | Input differential voltage | ± 0.5 | | |
| Current | Input current (all pins except power-supply pins) | ± 10 | | mA |
| | Output short-circuit ⁽²⁾ | Continuous | | |
| Temperature | Operating, T_A | -55 | 125 | °C |
| | Junction, T_J | 200 | | |
| | Storage, T_{stg} | -65 | 150 | |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Short-circuit to $V_S / 2$ (ground in symmetrical dual supply setups), one amplifier per package.

6.2 ESD Ratings

| | | VALUE | UNIT |
|-------------------------------------|--|------------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ± 4000 | V |
| | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ± 1500 | |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|-------------------------------|---------------|---------|-----|----------|------|
| Supply voltage, $(V+) - (V-)$ | Single-supply | 4 | | 36 | V |
| | Dual-supply | ± 2 | | ± 18 | |
| Specified temperature | | -40 | | 125 | °C |

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | OPA1622 | UNIT |
|-------------------------------|--|-----------|------|
| | | DRC (SON) | |
| | | 10 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 47.6 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 58.1 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 22.0 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 0.9 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 22.2 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | 4.1 | °C/W |

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics:

7 Detailed Description

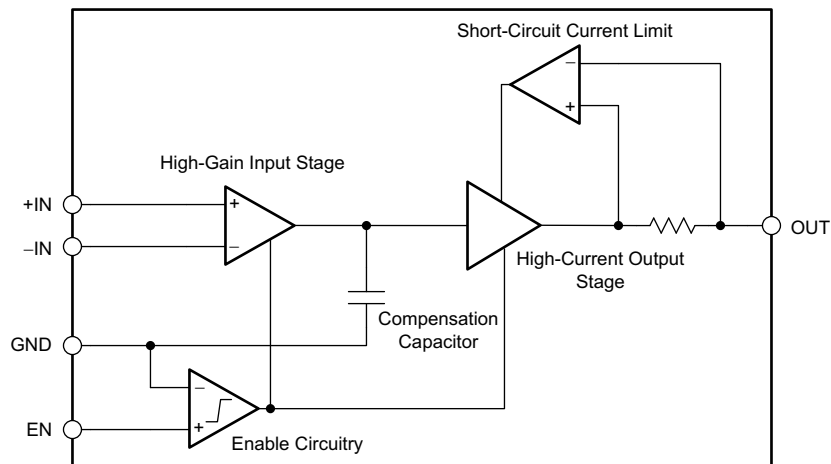

7.1 Overview

The OPA1622, dual, bipolar-input, audio operational amplifier uses a unique internal topology to deliver high output current with extremely low distortion while consuming minimal supply current. A single gain stage architecture, combining a high-gain transconductance input stage and a unity gain output stage, allows the OPA1622 to achieve an open-loop gain of 136 dB, even with 600-Ω loads.

The output stage of the OPA1622 is designed specifically to source and sink large amounts of current without degrading amplifier linearity. High-order distortion harmonics, produced by output stage crossover distortion, are greatly reduced with this design. The OPA1622 output stage also provides exceptionally low open-loop output impedance that improves stability with capacitive loads and is protected against short-circuit events.

A separate enable circuit maintains control of the input and output stage when the amplifier is placed into its shutdown mode and limits transients at the amplifier output when transitioning to and from this state. The enable circuit features logic levels referenced to the amplifier ground pin. This configuration simplifies the interface between the amplifier and the ground-referenced GPIO pins of microcontrollers. The addition of a ground pin to the amplifier provides several additional benefits. For example, the compensation capacitor between the input and output stages of the OPA1622 is referenced to the ground pin, greatly improving PSRR.

图 41. OPA1622 Simplified Schematic

7.3 Feature Description

7.3.1 Power Dissipation

The OPA1622 is capable of high output current with power-supply voltages up to ±18 V. Internal power dissipation increases when operating at high supply voltages. The power dissipated in the op amp (P_{OPA}) is calculated using 公式 1:

$$P_{OPA} = (V_+ - V_{OUT}) \times I_{OUT} = (V_+ - V_{OUT}) \times \frac{V_{OUT}}{R_L} \tag{1}$$

Feature Description (接下页)

In order to calculate the worst-case power dissipation in the op amp, the ac and dc cases must be considered separately.

In the case of constant output current (dc) to a resistive load, the maximum power dissipation in the op amp occurs when the output voltage is half the positive supply voltage. This calculation assumes that the op amp is sourcing current from the positive supply to a grounded load. If the op amp sinks current from a grounded load, modify 公式 2 to include the negative supply voltage instead of the positive.

$$P_{\text{OPA(MAX_DC)}} = P_{\text{OPA}} \left(\frac{V_+}{2} \right) = \frac{V_+^2}{4R_L} \quad (2)$$

The maximum power dissipation in the op amp for a sinusoidal output current (ac) to a resistive load occurs when the peak output voltage is $2/\pi$ times the supply voltage, given symmetrical supply voltages:

$$P_{\text{OPA(MAX_AC)}} = P_{\text{OPA}} \left(\frac{2V_+}{\pi} \right) = \frac{2 \cdot V_+^2}{\pi^2 \cdot R_L} \quad (3)$$

The dominant pathway for the OPA1622 to dissipate heat is through the package thermal pad and pins to the PCB. Copper leadframe construction used in the OPA1622 improves heat dissipation compared to conventional materials. PCB layout greatly affects thermal performance. Connect the OPA1622 package thermal pad to a copper pour at the most negative supply potential. This copper pour can be connected to a larger copper plane within the PCB using vias to improve power dissipation. 图 42 shows an analogous thermal circuit that can be used for approximating the junction temperature of the OPA1622. The power dissipated in the OPA1622 is represented by current source P_D ; the ambient temperature is represented by voltage source 25°C ; and the junction-to-board and board-to-ambient thermal resistances are represented by resistors θ_{JB} and θ_{BA} , respectively. The board-to-ambient thermal resistance is unique to every application. The sum of θ_{JB} and θ_{BA} is the junction-to-ambient thermal resistance of the system. The value for junction-to-ambient thermal resistance reported in the [Thermal Information](#) table is determined using the JEDEC standard test PCB. The voltages in the analogous thermal circuit at the points T_J and T_{PCB} represent the OPA1622 junction and PCB temperatures, respectively.

图 42. Approximate Thermal System Model of the OPA1622 Soldered to a PCB.

7.3.2 Thermal Shutdown

If the junction temperature of the OPA1622 exceeds 175°C , a thermal shutdown circuit disables the amplifier in order to protect the device from damage. The amplifier is automatically re-enabled after the junction temperature falls below approximately 160°C . If the condition that caused excessive power dissipation has not been removed, the amplifier oscillates between a shutdown and enabled state until the output fault is corrected.

Feature Description (接下页)

7.3.3 Enable Pin

The enable pin (EN) of the OPA1622 is used to toggle the amplifier enabled and disabled states. The logic levels defining these two states are: $V_{EN} \leq 0.78 \text{ V}$ (shutdown mode), and $V_{EN} \geq 0.82 \text{ V}$ (enabled). These threshold levels are referenced to the device ground pin. The enable pin can be driven by a GPIO pin from the system controller, discrete logic gates, or can be connected directly to the V+ supply. Do not leave the enable pin floating because the amplifier is prevented from being enabled. Likewise, do not place GPIO pins used to control the enable pin in a high-impedance state because this placement also prevents the amplifier from being enabled. A small current flows into the enable pin when a voltage is applied. Using the simplified internal schematic shown in 图 43, use 公式 4 to estimate the enable pin current:

$$I_{EN} = \frac{V_{EN} - 0.7 \text{ V}}{700 \text{ k}\Omega} \quad (4)$$

As illustrated in 图 43, the enable pin is protected by diodes to the amplifier power supplies. Do not connect the enable pin to voltages outside the limits defined in the [Specifications](#) section.

图 43. Enable Pin Simplified Internal Schematic

7.3.4 Ground Pin

The inclusion of a ground pin in the OPA1622 architecture allows the internal enable circuitry to be referenced to the system ground, eliminating the need for level shifting circuitry in many applications. The internal amplifier compensation capacitors are also referenced to this pin, greatly increasing the ac PSRR. For highest performance, connect the ground pin to a low-impedance reference point with minimal noise present. As shown in 图 43, the ground pin is protected by ESD diodes to the amplifier power supplies. Do not connect the ground pin to voltages outside the limits defined in the [Specifications](#) section.

7.3.5 Electrical Overstress

Designers often ask questions about the capability of an operational amplifier to withstand electrical overstress. These questions tend to focus on the device inputs, but can involve the supply voltage pins or even the output pin. Each of these different pin functions have electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal electrostatic discharge (ESD) protection is built into these circuits to protect them from accidental ESD events both before and during product assembly.

Having a good understanding of this basic ESD circuitry and its relevance to an electrical overstress event is helpful. 图 44 shows the ESD circuits contained in the OPA1622. The ESD protection circuitry involves several current-steering diodes connected from the input and output pins and routed back to the internal power-supply lines, where they meet at an absorption device internal to the operational amplifier. This protection circuitry is intended to remain inactive during normal circuit operation.

图 44. Equivalent Internal ESD Circuitry

7.3.6 Input Protection

The input pins of the OPA1622 are protected from excessive differential voltage with back-to-back diodes, as 图 45 shows. In most circuit applications, the input protection circuitry has no consequence. However, in low-gain or $G = +1$ circuits, fast-ramping input signals can forward bias these diodes because the output of the amplifier cannot respond quickly enough to the input ramp. If the input signal is fast enough to create this forward-bias condition, the input signal current must be limited to 10 mA or less. If the input signal current is not inherently limited, use an input series resistor (R_I) or a feedback resistor (R_F) to limit the signal input current. This input series resistor degrades the low-noise performance of the OPA1622 and is examined in the [Noise Performance](#) section. 图 45 shows an example configuration when both current-limiting input and feedback resistors are used.

图 45. Pulsed Operation

7.4 Device Functional Modes

The OPA1622 has two operating modes determined by the voltage between the enable and ground pins: a shutdown mode ($V_{EN} \leq 0.78V$) and an enabled mode ($V_{EN} \geq 0.82V$). The measured datasheet performance parameters specified in the [Typical Characteristics](#) and [Specifications](#) sections are given with the amplifier in the enabled mode, unless otherwise noted.

Device Functional Modes (接下页)

7.4.1 Shutdown Mode

When the enable pin voltage is below the logic low threshold, the OPA1622 enters a shutdown mode with minimal power consumption. In this state the output transistors of the amplifier are not powered on. However, do not consider the amplifier output to be high-impedance. Applying signals to the output of the OPA1622 while the device is in the shutdown mode can parasitically power the output stage, causing the OPA1622 output to draw current.

The OPA1622 enable circuitry limits transients at the output when transitioning into or out of shutdown mode. However, small output transients do still accompany this transition, as illustrated in 图 46 and 图 47. Note that in both figures the time scale is 1 μ s per division, indicating that the output transients are extremely brief in nature, and therefore not likely to be audible in headphone applications.

7.4.2 Output Transients During Power Up and Power Down

To minimize the possibility of output transients that might produce an audible *click* or *pop*, ramp the supply voltages for the OPA1622 symmetrically to their nominal values. Asymmetrical supply ramping can cause output transients during power up that can be audible in headphone applications. If possible, hold the enable pin low while the power supplies are ramping up or down. If the enable pin is not being independently controlled (for example, by a GPIO pin), use a voltage divider to hold the enable pin voltage below the logic-high threshold until the power supplies reach the specified minimum voltage, as shown in 图 48.

图 48. Voltage Divider Used to Hold Enable Low at Power-Up or Power-Down

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The low noise and distortion of the OPA1622 make the device well suited for a variety of applications in professional and consumer audio products. However, these same performance metrics also make the OPA1622 useful for industrial, test-and-measurement, and data-acquisition applications. The example shown here is only one possible application where the OPA1622 provides exceptional performance.

8.1.1 Noise Performance

图 49 shows the total circuit noise for varying source impedances with the op amp in a unity-gain configuration (no feedback resistor network, and therefore no additional noise contributions).

The OPA1622 is shown with total circuit noise calculated. The op amp contributes both a voltage noise component and a current noise component. The voltage noise is commonly modeled as a time-varying component of the offset voltage. The current noise is modeled as the time-varying component of the input bias current, and reacts with the source resistance to create a voltage component of noise. Therefore, the lowest noise op amp for a given application depends on the source impedance. For low source impedance, current noise is negligible, and voltage noise generally dominates. The low voltage and current noise of the OPA1622 op amp make the device an excellent choice for use in applications where the source impedance is less than 10 kΩ.

8.1.1.1 Noise Calculations

The equations in 图 50 show the calculation of the total circuit noise using these parameters:

- e_n = voltage noise
- I_n = current noise
- R_S = source impedance
- k = Boltzmann's constant = 1.38×10^{-23} J/K
- T = temperature in kelvins (K)

8.1.1.2 Application Curve

图 49. Noise Performance of the OPA1622 in a Unity-Gain Buffer Configuration

Application Information (接下页)

8.1.1.3 Basic Noise Calculations

Designing low-noise op amp circuits requires careful consideration of a variety of possible noise contributors, such as noise from the signal source, noise generated in the op amp, and noise from the feedback network resistors. The total noise of the circuit is the root sum squared combination of all noise components.

The resistive portion of the source impedance produces thermal noise proportional to the square root of the resistance. 图 49 plots this function. The source impedance is usually fixed; consequently, select the op amp and the feedback resistors to minimize the respective contributions to the total noise.

图 50 shows both inverting and noninverting op amp circuit configurations with gain. In circuit configurations with gain, the feedback network resistors also contribute noise.

The current noise of the op amp reacts with the feedback resistors to create additional noise components. Choose feedback resistor values that make these noise sources negligible. The equations for total noise are shown for both configurations.

Noise in Noninverting Gain Configuration

Noise at the output:

$$E_O^2 = \left[1 + \frac{R_2}{R_1} \right]^2 e_n^2 + e_1^2 + e_2^2 + (i_n R_2)^2 + e_S^2 + (i_n R_S)^2 \left[1 + \frac{R_2}{R_1} \right]^2$$

where

- $e_S = \sqrt{4kTR_S} \times \left[1 + \frac{R_2}{R_1} \right]$ = thermal noise of R_S
- $e_1 = \sqrt{4kTR_1} \times \left[\frac{R_2}{R_1} \right]$ = thermal noise of R_1
- $e_2 = \sqrt{4kTR_2}$ = thermal noise of R_2

Noise in Inverting Gain Configuration

Noise at the output:

$$E_O^2 = \left[1 + \frac{R_2}{R_1 + R_S} \right]^2 e_n^2 + e_1^2 + e_2^2 + (i_n R_2)^2 + e_S^2$$

where

- $e_S = \sqrt{4kTR_S} \times \left[\frac{R_2}{R_1 + R_S} \right]$ = thermal noise of R_S
- $e_1 = \sqrt{4kTR_1} \times \left[\frac{R_2}{R_1 + R_S} \right]$ = thermal noise of R_1
- $e_2 = \sqrt{4kTR_2}$ = thermal noise of R_2

For the OPA1622 at 1 kHz, $e_n = 2.8 \text{ nV}/\sqrt{\text{Hz}}$ and $i_n = 800 \text{ fA}/\sqrt{\text{Hz}}$.

图 50. Noise Calculation in Gain Configurations

Application Information (接下页)

8.1.2 Total Harmonic Distortion Measurements

The distortion produced by OPA1622 is below the measurement limit of many commercially-available distortion analyzers. However, a special test circuit, as shown in 图 51, can be used to extend the measurement capabilities.

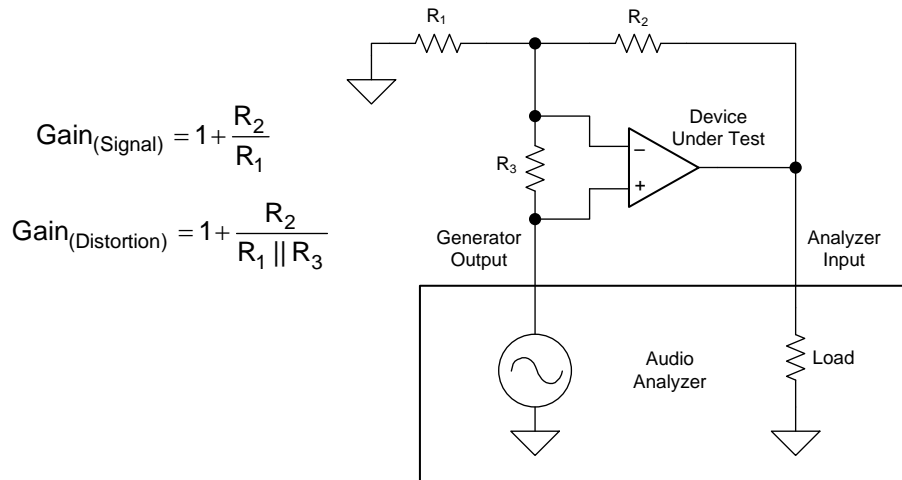

图 51. Distortion Test Circuit

Consider op amp distortion an internal error source that is referred to the input. 图 51 shows a circuit that causes the op amp distortion to be 101 times (approximately 40 dB) greater than that normally produced by the op amp. The addition of R_3 to the otherwise standard noninverting amplifier configuration alters the feedback factor or noise gain of the circuit. The closed-loop gain is unchanged, but the feedback available for error correction is reduced by a factor of 101, thus extending the resolution by 101. Note that the input signal and load applied to the op amp are the same as with conventional feedback without R_3 . Keep the value of R_3 small to minimize its effect on the distortion measurements.

Verify the validity of this technique by duplicating measurements at high gain or high frequency where the distortion is within the measurement capability of the test equipment.

8.2 Typical Application

The low distortion and high output-current capabilities of the OPA1622 make this device an excellent choice for headphone-amplifier applications in portable or studio applications. These applications typically employ an audio digital-to-analog converter (DAC) and a separate headphone amplifier circuit connected to the DAC output. High-performance audio DACs can have an output signal that is either a varying current or voltage. Voltage output configurations require less external circuitry, and therefore have advantages in cost, power consumption, and solution size. However, these configurations can offer slightly lower performance than current output configurations. Differential outputs are standard on both types of DACs. Differential outputs double the output signal levels that can be delivered on a single, low-voltage supply, and also allow for even-harmonics common to both outputs to be cancelled by external circuitry. A simplified representation of a voltage-output audio DAC is shown in 图 52. Two ac voltage sources (V_{AC}) deliver the output signal to the complementary outputs through their associated output impedances (R_{OUT}). Both output signals have a dc component as well, represented by dc voltage source V_{DC} . The headphone amplifier circuit connected to the output of an audio DAC must convert the differential output into a single-ended signal and be capable of producing signals of sufficient amplitude at the headphones to achieve reasonable listening levels.

图 52. OPA1622 Used as a Headphone Amplifier for a Voltage-Output Audio DAC

8.2.1 Design Requirements

- ± 5 -V power supplies
- 150-mW output power (32- Ω load)
- < -115 -dB THD+N at maximum output (32- Ω load)
- < 0.01 -dB magnitude deviation (20 Hz to 20 kHz)

8.2.2 Detailed Design Procedure

图 52 shows a schematic of a headphone amplifier circuit for voltage output DACs. An op amp is configured as a difference amplifier that converts the differential output voltage to single-ended. The values of the resistors in the difference amplifier circuit are determined by the specifications of the DAC, such as output voltage and output impedance, as well as the maximum output voltage desired at the headphone output. The op amp chosen must be capable of delivering the necessary current to the headphones and remain stable into typical headphone loads that can have capacitances as high as 400 pF. The following design process uses a hypothetical DAC with common values of output voltage and impedance for the design process. The specifications of the DAC are shown in 表 1:

表 1. Audio DAC Specifications Used for the Design Process

| PARAMETER | VALUE |
|-------------------------------------|--------------|
| Maximum differential output voltage | 2 V_{RMS} |
| Output impedance (R_{OUT}) | 200 Ω |
| Output dc offset | 1.65 V |

The gain of the difference amplifier in 图 52 is determined by the resistor values, and includes the output impedance of the DAC. For $R_2 = R_4$ and $R_1 = R_3$, the output voltage of the headphone amplifier circuit is shown in 公式 5:

$$V_{OUT} = V_{DAC} \frac{R_2}{R_1 + R_{OUT}} \quad (5)$$

The output voltage required for headphones depends on the headphone impedance, as well as the headphone efficiency (η), a measure of the sound pressure level (SPL, measured in dB) for a certain input power level (typically given at 1 mW). The headphone SPL at other power levels is calculated using 公式 6:

$$SPL(dB) = \eta + 10 \log \left(\frac{P_{IN}}{1 \text{ mW}} \right)$$

where

- η = efficiency
 - P_{IN} = input power to the headphones
- (6)

图 53 shows the input power required to produce certain SPLs for different headphone efficiencies. Typically, over-the-ear style headphones have lower efficiencies than in-ear types with 95 dB/mW being a common value.

图 53. Sound Pressure Level vs Input Power for Headphones of Various Efficiencies

In-ear headphones can have efficiencies of 115 dB/mW or greater, and therefore have much lower power requirements. The output power goal for this design is 150 mW; sufficient power to produce extremely loud sound pressure levels in a wide range of headphones. A 32-Ω headphone impedance is used for this requirement because 32 Ω is a very common value in headphones for portable applications. 公式 7 shows the voltage required for 32-Ω headphones:

$$V_O = \sqrt{P \times R} = \sqrt{150 \text{ mW} \times 32 \Omega} = 2.191 V_{RMS} \quad (7)$$

A tradeoff exists when selecting resistor values for this design. First, high resistor values contribute additional noise to the circuit, degrading the audio performance. However, extremely low resistor values draw excessive current from the DAC, increasing distortion. A value of 499 Ω is used for resistors R_1 and R_3 as a reasonable compromise between these two considerations. Resistor R_2 and R_4 can then be calculated as shown in 公式 8:

$$V_{OUT} = V_{DAC} \frac{R_2}{R_1 + R_{OUT}} \rightarrow 1.095 = \frac{R_2}{499 \Omega + 200 \Omega} \rightarrow R_2 = 765.4 \Omega \rightarrow 768 \Omega \quad (8)$$

In order to accommodate higher impedance headphones, increase the gain of the circuit to produce greater output voltages. However, increasing the gain also increases the noise of the circuit and limits the dynamic range of the circuit into lower impedance headphones. For this reason, some designers choose to select the headphone amplifier gain by using a switch.

Capacitors C_1 and C_2 limit the bandwidth of the circuit to prevent the unnecessary amplification of interfering signals. The maximum value of these capacitors is determined by the limitations on frequency response magnitude deviation detailed in the [Design Requirements](#) section. C_1 and C_2 combine with resistors R_2 and R_4 to form a pole, as shown in [公式 9](#):

$$f_p = \frac{1}{2\pi(R_2, R_4)(C_1, C_2)} \quad (9)$$

Calculate the minimum pole frequency allowable to meet the magnitude deviation requirements using [公式 10](#):

$$f_p \geq \frac{f}{\sqrt{\left(\frac{1}{G}\right)^2 - 1}} \geq \frac{20 \text{ kHz}}{\sqrt{\left(\frac{1}{0.999}\right)^2 - 1}} \geq 416.6 \text{ kHz}$$

where

- G represents the gain in decimal for a -0.01 -dB deviation at 20 kHz. (10)

Use [公式 11](#) to calculate the upper limit for the value of C_1 and C_2 in order to meet the goal for minimal magnitude deviation at 20 kHz.

$$C_1, C_2 \leq \frac{1}{2\pi(R_2, R_4)F_p} \leq \frac{1}{2\pi(768 \Omega)(416.6 \text{ kHz})} \leq 497 \text{ pF} \rightarrow 470 \text{ pF} \quad (11)$$

8.2.3 Application Curves

The circuit described in [图 52](#) is constructed using 0.1% tolerance thin-film resistors (0603 package) and surface-mount film capacitors. The performance of the circuit is measured using a high-performance audio analyzer and is displayed in [图 54](#) through [图 59](#). The maximum output power for three common headphone impedances is shown in [表 2](#)

表 2. Maximum Output Power and THD+N Before Clipping for Common Headphone Impedances

| LOAD IMPEDANCE (Ω) | MAXIMUM OUTPUT POWER BEFORE CLIPPING (mW) | THD+N AT MAXIMUM OUTPUT POWER (dB) |
|--------------------------------|--|---------------------------------------|
| 16 | 95 | -114.2 |
| 32 | 150 | -118.7 |
| 600 | 11.3 | -119.4 |

The maximum output power delivered to low impedance headphone loads (16 Ω and 32 Ω) is limited by the output current capabilities of the amplifier. For the 600- Ω case, the maximum power delivered is limited by the output voltage capability of the amplifier and depends greatly on the power-supply voltages used. [图 55](#) shows the maximum output voltage achievable for each load before the onset of clipping (± 5 -V supplies), indicated by a sharp increase in distortion.

As more current is delivered by the output transistors of an amplifier, additional distortion is produced. At low frequencies, this distortion is corrected by the feedback loop of the amplifier. However, as the loop gain of the amplifier begins to decline at high frequencies, the overall distortion begins to climb. The unique output stage design of the OPA1622 greatly reduces the additional distortion at high frequency when delivering large currents, as shown in [图 56](#). High-ordered harmonics (above the 2nd and 3rd) are also kept to a minimal level at high output powers, as shown in [图 57](#) through [图 59](#).

图 59. Output Spectrum

9 Power Supply Recommendations

The OPA1622 op amp operates from $\pm 2\text{-V}$ to $\pm 18\text{-V}$ supplies, while maintaining excellent performance. However, some applications do not require equal positive and negative output voltage swing. With the OPA1622, power-supply voltages do not need to be equal. For example, the positive supply could be set to $+25\text{ V}$ with the negative supply at -5 V .

In all cases, the common-mode voltage must be maintained within the specified range. Key parameters are specified over the temperature range of $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$. Parameters that vary with operating voltage or temperature are shown in the *Typical Characteristics* section.

10 Layout

10.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Connect low-ESR, $0.1\text{-}\mu\text{F}$ ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from $V+$ to ground is applicable for single-supply applications. The bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry, because noise can propagate into analog circuitry through the power pins of the circuit as a whole and the op amp specifically.
- Connect the IC ground pin to a low-impedance, low-noise, system reference point, such as an analog ground.
- Place the external components as close to the device as possible. As shown in [Figure 60](#), keep feedback resistors close to the inverting input to minimize parasitic capacitance and the feedback loop area.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- For proper amplifier function, connect the package thermal pad to the most negative supply voltage (VEE).

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|-----------------|------|-------------|-------------------------|-------------------------|----------------------|--------------|-------------------------|-------------------------|
| OPA1622IDRCR | ACTIVE | VSON | DRC | 10 | 3000 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | O1622 | Samples |
| OPA1622IDRCT | ACTIVE | VSON | DRC | 10 | 250 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | O1622 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |
|--------------|--------------|-----------------|------|------|--------------------|--------------------|---------|---------|---------|---------|--------|---------------|
| OPA1622IDRCR | VSON | DRC | 10 | 3000 | 330.0 | 12.4 | 3.3 | 3.3 | 1.1 | 8.0 | 12.0 | Q2 |
| OPA1622IDRCT | VSON | DRC | 10 | 250 | 180.0 | 12.4 | 3.3 | 3.3 | 1.1 | 8.0 | 12.0 | Q2 |

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Length (mm) | Width (mm) | Height (mm) |
|--------------|--------------|-----------------|------|------|-------------|------------|-------------|
| OPA1622IDRCR | VSON | DRC | 10 | 3000 | 367.0 | 367.0 | 35.0 |
| OPA1622IDRCT | VSON | DRC | 10 | 250 | 210.0 | 185.0 | 35.0 |

GENERIC PACKAGE VIEW

DRC 10

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4204102-3/M

EXAMPLE BOARD LAYOUT

DRC0010J

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:20X

SOLDER MASK DETAILS

4218878/B 07/2018

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

DRC0010J

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 11:
80% PRINTED SOLDER COVERAGE BY AREA
SCALE:25X

4218878/B 07/2018

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和和该等应用所用 TI 产品的功能而设计。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关单项 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与应用 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有任何安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准而设计。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
