

具有开漏比较器和基准的 INA20x 高侧测量电流分流监控器

1 特性

- 完整电流感测解决方案
- 三种增益可供选择：
 - INA200 = 20V/V
 - INA201 = 50V/V
 - INA202 = 100V/V
- 0.6V 内部电压基准
- 内部漏极开路比较器
- 比较器锁存功能
- 共模范围：-16V 至 80V
- 高精度：整个温度范围内的最大误差为 3.5%
- 带宽：500kHz (INA200)
- 静态电流：1800μA（最大值）
- 封装：SOIC-8、VSSOP-8

2 应用

- 笔记本电脑
- 手机
- 电信设备
- 汽车
- 电源管理
- 电池充电器
- 焊接设备

3 说明

INA200、INA201 和 INA202 器件是具有电压输出和集成比较器的高侧电流分流监控器。INA20x 器件能够在 -16V 至 +80V 范围内的共模电压下感测分流器两端的压降。INA20x 系列器件可提供三种输出电压级别，即 20V/V、50V/V 和 100V/V，带宽高达 500kHz。

INA200、INA201 和 INA202 器件整合了一个开漏比较器以及提供 0.6V 阈值的内部基准。外部分压器可设定电流跳变点。比较器具有锁存功能，可通过将 **RESET** 引脚接地（或悬空）进入透明状态。

INA200、INA201 和 INA202 器件由单个 2.7V 至 18V 电源供电，消耗的最大电源电流为 1800μA。封装选项包括极小型 VSSOP-8 和

SOIC-8。所有版本的额定扩展工作温度范围均为 -40°C 至 +125°C。

器件信息⁽¹⁾

器件型号	封装	封装尺寸（标称值）
INA200	SOIC (8)	4.90mm x 3.91mm
INA201	VSSOP (8)	3.00mm x 3.00mm
INA202

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision D (October 2015) to Revision E	Page
• Reformatted <i>Thermal Information</i> table note	4
• Corrected typo in <i>Voltage Output</i> section in <i>Electrical Characteristics</i> table	6
• 已添加 text to <i>Comparator</i> subsection in <i>Feature Description</i> section	14
• 已添加 图 31 to <i>Feature Description</i> section	18
• 已添加 <i>Output vs Supply Ramp Considerations</i> subsection in <i>Feature Description</i> section	23
• 已添加 图 36, 图 37, and 图 38	23

Changes from Revision C (October 2010) to Revision D	Page
• Added <i>ESD Ratings</i> table, <i>Thermal Information</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	4

Changes from Revision B (October, 2007) to Revision C	Page
• 修改了首页上的原理图	1
• 已更改 数据表标题	1
• 根据最新标准更新了文档格式	1

5 Pin Configuration and Functions

**DGK and D Packages
8-Pin VSSOP and SOIC
Top View**

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
CMP _{IN}	3	Analog input	Comparator input
CMP _{OUT}	6	Analog output	Comparator output
GND	4	Analog	Ground
OUT	2	Analog output	Output voltage
RESET	5	Analog input	Comparator reset pin, active low
V _{IN-}	7	Analog input	Connect to shunt low side
V _{IN+}	8	Analog input	Connect to shunt high side
V _S	1	Analog	Power supply

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V_s		2.7	18	V
Current-shunt monitor analog inputs, V_{IN+} , V_{IN-}	Differential (V_{IN+}) – (V_{IN-})	–18	18	V
	Common-mode ⁽²⁾	–16	80	V
Comparator analog input and reset pins ⁽²⁾		GND – 0.3	(V_s) + 0.3	V
Analog output, OUT ⁽²⁾		GND – 0.3	(V_s) + 0.3	V
Comparator output, OUT ⁽²⁾		GND – 0.3	18	V
Input current into any pin ⁽²⁾			5	mA
Operating temperature		–55	150	°C
Junction temperature		–65	150	°C
Storage temperature, T_{stg}		–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) This voltage may exceed the ratings shown if the current at that pin is limited to 5 mA.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±4000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CM}	Common-mode input voltage	–16	12	80	V
V_s	Operating supply voltage	2.7	12	18	V
T_A	Operating free-air temperature	–40	25	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		INA20x		UNIT
		D (SOIC)	DGK (SOIC)	
		8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	110.5	162.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	50.4	37.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	52.7	82.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	7.8	1.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	51.9	81.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics: Current-Shunt Monitor

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = \text{GND}$, (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT						
V_{SENSE}	Full-scale sense input voltage	$V_{SENSE} = V_{IN+} - V_{IN-}$		0.15	$(V_S - 0.25) / \text{Gain}$	V
V_{CM}	Common-mode input range	$T_A = -40^\circ\text{C}$ to 125°C	-16		80	V
CMR	Common-mode rejection	$V_{IN+} = -16\text{ V}$ to 80 V	80	100		dB
		$V_{IN+} = 12\text{ V}$ to 80 V , $T_A = -40^\circ\text{C}$ to 125°C	100	123		dB
V_{OS}	Offset voltage, RTI ⁽¹⁾	$T_A = 25^\circ\text{C}$		± 0.5	± 2.5	mV
		$T_A = 25^\circ\text{C}$ to 125°C			± 3	mV
		$T_A = -40^\circ\text{C}$ to 25°C			± 3.5	mV
dV_{OS}/dT	Offset voltage, RTI, vs temperature	T_{MIN} to T_{MAX} , $T_A = -40^\circ\text{C}$ to 125°C		5		$\mu\text{V}/^\circ\text{C}$
PSR	Offset voltage, RTI, vs power supply	$V_{OUT} = 2\text{ V}$, $V_{IN+} = 18\text{ V}$, 2.7 V , $T_A = -40^\circ\text{C}$ to 125°C		2.5	100	$\mu\text{V}/\text{V}$
I_B	Input bias current, V_{IN-} pin	$T_A = -40^\circ\text{C}$ to 125°C		± 9	± 16	μA

(1) Offset is extrapolated from measurements of the output at 20-mV and 100-mV V_{SENSE} .

(6) Specified by design.

6.6 Electrical Characteristics: Comparator

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, and $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
OFFSET VOLTAGE					
Threshold	T _A = 25°C	590	608	620	mV
	T _A = −40°C to 125°C	586		625	mV
Hysteresis ⁽¹⁾	T _A = −40°C to 85°C		−8		mV
INPUT BIAS CURRENT ⁽²⁾					
Input bias current, CMP _{in} PIN			0.005	10	nA
Input bias current, CMP _{in} PIN, vs temperature	T _A = −40°C to 125°C			15	nA
INPUT VOLTAGE RANGE					
Input voltage range, CMP _{in} PIN		0 V to V _S − 1.5 V			V
OUTPUT (OPEN-DRAIN)					
Large-signal differential voltage gain	CMP V _{OUT} 1 V to 4 V, R _L ≥ 15 kΩ connected to 5 V		200		V/mV
I _{LKG}	High-level leakage current ⁽³⁾⁽⁴⁾	V _{ID} = 0.4 V, V _{OH} = V _S	0.0001	1	μA
V _{OL}	Low-level output voltage ⁽³⁾	V _{ID} = −0.6 V, I _{OL} = 2.35 mA	220	300	mV
RESPONSE TIME					
Response time ⁽⁵⁾	R _L to 5 V, C _L = 15 pF, 100-mV Input Step with 5-mV overdrive		1.3		μs
RESET					
RESET threshold ⁽⁶⁾			1.1		V
Logic input impedance			2		MΩ
Minimum RESET pulse width			1.5		μs
RESET propagation delay			3		μs

- (1) Hysteresis refers to the threshold (the threshold specification applies to a rising edge of a noninverting input) of a falling edge on the noninverting input of the comparator; refer to [Figure 1](#).
- (2) Specified by design.
- (3) V_{ID} refers to the differential voltage at the comparator inputs.
- (4) Open-drain output can be pulled to the range of 2.7 to 18 V, regardless of V_S .
- (5) The comparator response time specified is the interval between the input step function and the instant when the output crosses 1.4 V.
- (6) The RESET input has an internal 2 M Ω (typical) pull-down. Leaving RESET open results in a LOW state, with transparent comparator operation.

6.7 Electrical Characteristics: General

at $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{CM} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ connected from CMP_{OUT} to V_S , and $CMP_{IN} = 1\text{ V}$, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY					
V_S Operating power supply	$T_A = -40^\circ\text{C}$ to 125°C	2.7		18	V
I_Q Quiescent current	$V_{OUT} = 2\text{ V}$		1350	1800	μA
	$V_{SENSE} = 0\text{ mV}$, $T_A = -40^\circ\text{C}$ to 125°C			1850	μA
Comparator power-on reset threshold ⁽¹⁾			1.5		V
TEMPERATURE					
Specified temperature		-40		125	$^\circ\text{C}$
Operating temperature		-55		150	$^\circ\text{C}$
Storage temperature		-65		150	$^\circ\text{C}$
θ_{JA} Thermal resistance	VSSOP-8 Surface-Mount		200		$^\circ\text{C/W}$
	SOIC-8		150		$^\circ\text{C/W}$

- (1) The INA200, INA201, and INA202 are designed to power-up with the comparator in a defined reset state as long as RESET is open or grounded. The comparator is in reset as long as the power supply is below the voltage shown here. The comparator assumes a state based on the comparator input above this supply voltage. If RESET is high at power-up, the comparator output comes up high and requires a reset to assume a low state, if appropriate.

7 Detailed Description

7.1 Overview

The INA200, INA201, and INA202 devices are high-side current-shunt monitors with voltage output. The INA20x devices can sense drops across shunts at common-mode voltages from -16 V to 80 V . The INA200–INA202 devices are available with three output voltage scales: 20 V/V , 50 V/V , and 100 V/V , with up to 500-kHz bandwidth. The INA200, INA201, and INA202 devices incorporate an open-drain comparator and internal reference providing a 0.6-V threshold. External dividers set the current trip point. The comparator includes a latching capability, that can be made transparent by grounding (or leaving open) the RESET pin. The INA200, INA201, and INA202 devices operate from a single 2.7 to 18-V supply, drawing a maximum of $1800\text{ }\mu\text{A}$ of supply current. Package options include the very small MSOP-8 and the SO-8. All versions are specified over the extended operating temperature range of -40°C to $+125^{\circ}\text{C}$.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Basic Connections

Figure 26 shows the basic connections of the INA20x devices. The input pins (V_{IN+} and V_{IN-}) must be connected as closely as possible with Kelvin connections to the shunt resistor to minimize any resistance in series with the shunt resistance.

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

图 26. INA200 Basic Connections

7.3.2 Selecting R_S

The selected value for the shunt resistor, R_S , depends on the application and is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement line. High values of R_S provide better accuracy at lower currents by minimizing the effects of offset, while low values of R_S minimize voltage loss in the supply line. For most applications, using an R_S value that provides a full-scale shunt voltage range of 50 mV to 100 mV results in the best performance. Maximum input voltage for accurate measurements is 500 mV, but output voltage is limited by supply.

7.3.3 Comparator

The INA200, INA201, and INA202 devices incorporate an open-drain comparator. This comparator typically has 2 mV of offset and a 1.3-μs (typical) response time. The output of the comparator latches and is reset through the $\overline{\text{RESET}}$ pin; see 图 28.

When V_S and $\overline{\text{RESET}}$ are different, TI recommends adding a low-pass filter (LPF) on the $\overline{\text{RESET}}$ pin to avoid comparator behavior inconsistent with the data sheet. For instance, with a 12-V supply and a 3.3-V $\overline{\text{RESET}}$, a rise time of 400 ns is appropriate. Similarly, with an 18-V supply and a 2.7-V $\overline{\text{RESET}}$, a 1-μs rise time is appropriate; see 图 31.

图 27. Input Filter (Gain Error: 1.5% to 2.8%)

图 28. Comparator Latching Capability

Copyright © 2017, Texas Instruments Incorporated

- (1) Q1 cascodes the comparator output to drive a high-side FET (the 2N3904) shown is good up to 60 V. The shunt can be located in any one of the three locations shown. The latching capability must be used in shutdown applications to prevent oscillation at the trip point.

7.4 Device Functional Modes

7.4.1 Input Filtering

An obvious and straightforward location for filtering is at the output of the INA20x series; however, this location negates the advantage of the low output impedance of the internal buffer. The only other option for filtering is at the input pins of the INA20x devices, which is complicated by the internal 5 kΩ + 30% input impedance. This is shown in [Figure 27](#). Using the lowest possible resistor values minimizes the initial shift in gain and effects of tolerance. The effect on initial gain is shown in [Equation 1](#):

$$\text{Gain Error \%} = 100 - \left[100 \times \frac{5\text{k}\Omega}{5\text{k}\Omega + R_{\text{FILT}}} \right] \quad (1)$$

Total effect on gain error can be calculated by replacing the 5-kΩ term with 5 kΩ – 30%, (or 3.5 kΩ) or 5 kΩ + 30% (or 6.5 kΩ). The tolerance extremes of R_{FILT} can be inserted into the equation. If a pair of 100-Ω 1% resistors are used on the inputs, the initial gain error equals 1.96%. Worst-case tolerance conditions always occur at the lower excursion of the internal 5-kΩ resistor (3.5 kΩ), and the higher excursion of R_{FILT} – 3% in this case.

The specified accuracy of the INA20x devices must then be combined in addition to these tolerances. While this discussion treated accuracy worst-case conditions by combining the extremes of the resistor values, it is appropriate to use geometric mean or root sum square calculations to total the effects of accuracy variations.

7.4.2 Accuracy Variations as a Result of V_{SENSE} and Common-Mode Voltage

The accuracy of the INA200, INA201, and INA202 current shunt monitors is a function of two main variables: V_{SENSE} (V_{IN+} – V_{IN–}), common-mode voltage, (V_{CM}), relative to the supply voltage (V_S). V_{CM} is expressed as (V_{IN+} + V_{IN–}) / 2; however, in practice, V_{CM} is seen as the voltage at V_{IN+} because the voltage drop across V_{SENSE} is typically small.

This section addresses the accuracy of these specific operating regions:

- Normal Case 1: V_{SENSE} ≥ 20 mV, V_{CM} ≥ V_S
- Normal Case 2: V_{SENSE} ≥ 20 mV, V_{CM} < V_S
- Low V_{SENSE} Case 1: V_{SENSE} < 20 mV, –16 V ≤ V_{CM} < 0
- Low V_{SENSE} Case 2: V_{SENSE} < 20 mV, 0 V ≤ V_{CM} ≤ V_S
- Low V_{SENSE} Case 3: V_{SENSE} < 20 mV, V_S < V_{CM} ≤ 80 V

7.4.2.1 Normal Case 1: V_{SENSE} ≥ 20 mv, V_{CM} ≥ V_S

This region of operation provides the highest accuracy. Here, the input offset voltage is characterized and measured using a two-step method. First, the gain is determined by [Equation 2](#).

$$G = \frac{V_{\text{OUT1}} - V_{\text{OUT2}}}{100\text{mV} - 20\text{mV}}$$

where

- V_{OUT1} = output voltage with V_{SENSE} = 100 mV
 - V_{OUT2} = output voltage with V_{SENSE} = 20 mV
- (2)

Then the offset voltage is measured at V_{SENSE} = 100 mV, and referred to the input (RTI) of the current shunt monitor, as shown in [Electrical Characteristics: Current-Shunt Monitor](#).

$$V_{\text{OSRTI}} (\text{Referred-To-Input}) = \left[\frac{V_{\text{OUT1}}}{G} \right] - 100\text{mV} \quad (3)$$

In the [Typical Characteristics](#), [Figure 7](#) shows the highest accuracy for the this region of operation. In this plot, V_S = 12 V. For V_{CM} ≥ 12 V, the output error is at the minimum value. This case creates the V_{SENSE} ≥ 20-mV output specifications in [Electrical Characteristics: Current-Shunt Monitor](#).

Device Functional Modes (接下页)

7.4.2.2 Normal Case 2: $V_{SENSE} \geq 20 \text{ mV}$, $V_{CM} < V_S$

This region of operation is less accurate than normal case 1 as a result of the common-mode operating area in which the part functions, as shown in the 图 7 curve (图 7). As noted, for this graph $V_S = 12 \text{ V}$; for $V_{CM} < 12 \text{ V}$, the output error increases as V_{CM} decreases to less than 12 V , with a typical maximum error of 0.005% at the most negative $V_{CM} = -16 \text{ V}$.

7.4.2.3 Low V_{SENSE} Case 1: $V_{SENSE} < 20 \text{ mV}$, $-16 \text{ V} \leq V_{CM} < 0$ and Low V_{SENSE} Case 3: $V_{SENSE} < 20 \text{ mV}$, $V_S < V_{CM} \leq 80 \text{ V}$

Although the INA200 family of devices are not designed for accurate operation in these regions, some applications are exposed to these conditions. For example, when monitoring power supplies that are switched on and off while V_S is still applied to the INA20x devices, it is important to know what the behavior of the devices is in these regions.

As V_{SENSE} approaches 0 mV , in these V_{CM} regions, the accuracy of the device output degrades. A larger-than-normal offset can appear at the current shunt monitor output with a typical maximum value of $V_{OUT} = 300 \text{ mV}$ for $V_{SENSE} = 0 \text{ mV}$. As V_{SENSE} approaches 20 mV , V_{OUT} returns to the expected output value with accuracy as shown in [Electrical Characteristics: Current-Shunt Monitor](#). 图 32 shows this effect using the INA202 (gain = 100).

图 32. Example For Low V_{SENSE} Cases 1 and 3 (INA202, Gain = 100)

7.4.2.4 Low V_{SENSE} Case 2: $V_{SENSE} < 20 \text{ mV}$, $0 \text{ V} \leq V_{CM} \leq V_S$

This region of operation is the least accurate for the INA20x family. To achieve the wide input common-mode voltage range, these devices use two op amp front ends in parallel. One op amp front end operates in the positive input common-mode voltage range, and the other in the negative input region. For this case, neither of these two internal amplifiers dominates and overall loop gain is low. Within this region, V_{OUT} approaches voltages close to linear operation levels for normal case 2. This deviation from linear operation becomes greatest the closer V_{SENSE} approaches 0 V . Within this region, as V_{SENSE} approaches 20 mV , device operation is closer to that is described in normal case 2. 图 33 shows this behavior for the INA202. The V_{OUT} maximum peak for this case is tested by maintaining a constant V_S , setting V_{SENSE} equal to 0 mV and sweeping V_{CM} from 0 V to V_S . The exact V_{CM} at which V_{OUT} peaks during this test varies from device to device, but the V_{OUT} maximum peak is tested to be less than the specified V_{OUT} tested limit.

Device Functional Modes (接下页)

NOTE: (1) INA200 V_{OUT} Tested Limit = 0.4V. INA201 V_{OUT} Tested Limit = 1V.

图 33. Example For Low V_{SENSE} Case 2 (INA202, Gain = 100)

7.4.3 Transient Protection

The –16 to 80 V common-mode range of the INA20x devices is ideal for withstanding automotive fault conditions ranging from 12-V battery reversal up to 80-V transients, since no additional protective components are required up to those levels. In the event that the INA20x devices are exposed to transients on the inputs in excess of their ratings, then external transient absorption with semiconductor transient absorbers (such as Zeners) are required. TI does not recommend using MOVs or VDRs, except when they are used in addition to a semiconductor transient absorber. Select the transient absorber so the absorber does not allow the INA20x devices to be exposed to transients greater than 80 V (that is, allow for transient absorber tolerance and additional voltage due to transient absorber dynamic impedance). Despite the use of internal Zener-type ESD protection, the INA20x devices do not lend themselves to using external resistors in series with the inputs since the internal gain resistors can vary up to $\pm 30\%$. (If gain accuracy is not important, then resistors can be added in series with the INA200, INA201, and INA202 inputs with two equal resistors on each input.)

7.4.4 Output Voltage Range

The output of the INA20x devices is accurate within the output voltage swing range set by the power supply pin (V_S .) This performance is best illustrated when using the INA202 (a gain of 100 version), where a 100-mV full-scale input from the shunt resistor requires an output voltage swing of 10 V, and a power-supply voltage sufficient to achieve 10 V on the output.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The INA20x series is designed to enable simple configuration for detecting overcurrent conditions and current monitoring in an application. This device is individually targeted towards overcurrent detection of a single threshold. However, this device can pair with additional devices and circuitry to create more complex monitoring functional blocks.

8.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

(1) In this case, Q inverts the comparator output.

图 34. Low-Side Switch Overcurrent Shutdown

8.2.1 Design Requirements

The device measures current through a resistive shunt with current flowing in one direction that enables detection of an overcurrent event only when the differential input voltage exceeds the threshold limit. When the current reaches the set limit of the divider R_1 / R_2 , the output of CMP_{OUT} transitions high, which turns Q1 on, pulls the gate of the pass-FET low, and turns off the flow off current.

Typical Application (接下页)

8.2.2 Detailed Design Procedure

图 34 显示了设备的基本连接。输入终端 (IN+ 和 IN -) 必须尽可能紧密地连接到电流 sensing 电阻器，以最小化与分流电阻器串联的任何电阻。分流电阻器与输入终端之间的额外电阻会导致测量误差。当输入电流流经此外部输入电阻时，分流电阻器上的电压与到达输入终端的电压不同。

使用 INA20x 的增益和分流值来计算所需的 trip 电流的 OUT 电压。配置 R1 和 R2 使得电流 trip 点等于 0.6-V 参考电压。

8.2.3 Application Curve

图 35. Low-Side Switch Overcurrent Shutdown Response

9 Power Supply Recommendations

The input circuitry of the INA20x devices can accurately measure beyond the power-supply voltage, V_s . For example, the V_s power supply is 5 V, whereas the load power-supply voltage is up to 80 V. However, the output voltage range of the OUT pin is limited by the voltages on the power supply pin.

9.1 Output vs Supply Ramp Considerations

图 36, 图 37, 和 图 38 显示了典型输出电压的高边和低边配置，具有给定的 ramp 电源电压。这些电源电压上的波动可能会要求控制器在空白时间中忽略这些伪影。

Output vs Supply Ramp Considerations (接下页)

图 38. Analog Output vs Supply Ramp (INA202)

10 Layout

10.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very-low-ohmic value of the current resistor, any additional high-current carrying impedance causes significant measurement errors.
- The power-supply bypass capacitor must be placed as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

10.2 Layout Example

图 39. INA20x Layout Example

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
