

TLV5621I

LOW-POWER QUADRUPLE 8-BIT DIGITAL-TO-ANALOG CONVERTER

SLAS138B – APRIL 1996 – REVISED FEBRUARY 1997

- 2.7-V to 5.5-V Single-Supply Operation
- Four 8-Bit Voltage Output DACs
- One-Half Power 8-Bit Voltage Output DAC
- Fast Serial Interface . . . 1 MHz Max
- Simple Two-Wire Interface In Single Buffered Mode
- High-Impedance Reference Inputs For Each DAC
- Programmable for 1 or 2 Times Output Range
- Simultaneous-Update Facility In Double-Buffered Mode
- Internal Power-On Reset
- Industry Temperature Range
- Low Power Consumption
- Half-Buffered Output
- Power-Down Mode

applications

- Programmable Voltage Sources
- Digitally-Controlled Amplifiers/Attenuators
- Cordless/Wireless Communications
- Automatic Test Equipment
- Portable Test Equipment
- Process Monitoring and Control
- Signal Synthesis

description

The TLV5621I is a quadruple 8-bit voltage output digital-to-analog converter (DAC) with buffered reference inputs (high impedance). The DAC produces an output voltage that ranges between either one or two times the reference voltages and GND, and the DAC is monotonic. The device is simple to use since it operates from a single supply of 2.7 V to 5.5 V. A power-on reset function is incorporated to provide repeatable start-up conditions. A global hardware shut-down terminal and the capability to shut down each individual DAC with software are provided to minimize power consumption.

Digital control of the TLV5621I is over a simple 3-wire serial bus that is CMOS compatible and easily interfaced to all popular microprocessor and microcontroller devices. A TLV5621I 11-bit command word consists of eight bits of data, two DAC select bits, and a range bit for selection between the times one or times two output range. The TLV5621I digital inputs feature Schmitt triggers for high noise immunity. The DAC registers are double buffered which allows a complete set of new values to be written to the device, and then under control of the HWACT signal, all of the DAC outputs are updated simultaneously.

The 14-terminal small-outline (D) package allows digital control of analog functions in space-critical applications. The TLV5621I does not require external trimming. The TLV5621I is characterized for operation from -40°C to 85°C .

LOW-POWER QUADRUPLE 8-BIT DIGITAL-TO-ANALOG CONVERTER

SLAS138B – APRIL 1996 – REVISED FEBRUARY 1997

functional block diagram

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
CLK	7	I	Serial interface clock, data enters on the negative edge
DACA	12	O	DAC A analog output
DACB	11	O	DAC B analog output
DACC	10	O	DAC C analog output
DACD	9	O	DAC D analog output
DATA	6	I	Serial-interface digital-data input
EN	8	I	Input enable
GND	1		Ground return and reference
HWACT	13	I	Global hardware activate
REFA	2	I	Reference voltage input to DACA
REFB	3	I	Reference voltage input to DACB
REFC	4	I	Reference voltage input to DACC
REFD	5	I	Reference voltage input to DACD
V _{DD}	14		Positive supply voltage

detailed description

The TLV5621 is implemented using four resistor-string DACs. The core of each DAC is a single resistor with 256 taps, corresponding to the 256 possible codes listed in Table 1. One end of each resistor string is connected to GND and the other end is fed from the output of the reference input buffer. Monotonicity is maintained by use of the resistor strings. Linearity depends upon the matching of the resistor elements and upon the performance of the output buffer. Because the inputs are buffered, the DACs always present a high-impedance load to the reference source.

Each DAC output is buffered by a configurable-gain output amplifier, which can be programmed to times one or times two gain.

On power-up, the DACs are reset to CODE 0.

Each output voltage is given by:

$$V_O(\text{DACA|B|C|D}) = \text{REF} \times \frac{\text{CODE}}{256} \times (1 + \text{RNG bit value})$$

where CODE is in the range 0 to 255 and the range (RNG) bit is a 0 or 1 within the serial control word.

Table 1. Ideal-Output Transfer

D7	D6	D5	D4	D3	D2	D1	D0	OUTPUT VOLTAGE

data interface

The data interface has two modes of operation; single and double buffered. Both modes serially clock in bits of data using DATA and CLK whenever EN is high. When EN is low, CLK is disabled and data cannot be loaded into the buffers.

In the single buffered mode, the DAC outputs are updated on the last/twelfth falling edge of CLK, so this mode only requires a two-wire interface with EN tied high (see Figure 1 and Figure 2).

In the double buffered mode (startup default), the outputs of the DACs are updated on the falling edge of the EN strobe (see Figure 3 and Figure 4). This allows multiple devices to share data and clock lines by having only separate EN lines.

single-buffer mode (MODE = 1)

When a two wire interface is used, EN is tied high and the input to the device is always active; therefore, random data can be clocked into the input latch. In order to regain word synchronization, twelve zeros are clocked in as shown in Figure 1, and then a data or control word is clocked in. In Figure 1, the MODE bit is set to one, and a control word is clocked in with the DAC outputs becoming active after the last falling edge of the control word.

Figure 2 shows valid data being written to a DAC, note that CLK is held low while the data is invalid. Data can be written to all four DACs and then the control word is clocked in which sets the MODE bit to 1. At the end of the control word, the data is latched to the inputs of the DACs.

Note that once the MODE bit has been set, it is not possible to clear it, i.e., it is not possible to move from single to double-buffered mode.

NOTE A: Twelve zeros enable word synchronization and the output can change after the leading edge of CLK depending on the data in the latches.

Figure 1. Register Write Operation Following Noise or Undefined Levels on DATA or CLK (Single-Buffer Mode)

NOTE A: EN is held high and data is written to a DAC register. The data is latched to the output of the DAC on the falling edge of the last CLK of the control word, where the mode is set.

Figure 2. First Nonzero Write Operation After Startup (EN = High)

double-buffered mode (MODE = 0)

In this mode, data is only latched to the output of the DACs on the falling edge of the EN strobe. Therefore, all four DACs can be written to before updating their outputs.

Any number of input data blocks can be written with all having the same length. Subsequent data blocks simply overwrite previous ones with the same address until EN goes low.

Multiple data blocks can be written in any sequence provided signal timing limits are met. The negative going edge of EN terminates and latches all data.

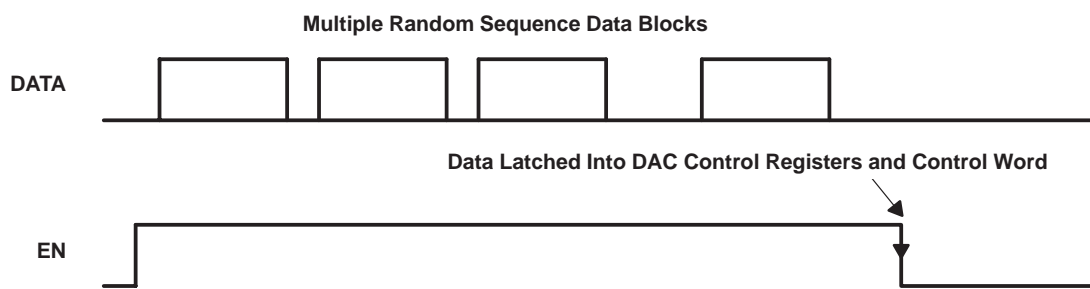

Figure 3. Data and Control Serial Control

TLV56211
LOW-POWER QUADRUPLE 8-BIT DIGITAL-TO-ANALOG CONVERTER

SLAS138B – APRIL 1996 – REVISED FEBRUARY 1997

NOTE A: Data is written to the output of a DAC, and the data is latched to the output on the falling edge of EN. A control word then selects double-buffered mode. When the range is changed, the output changes on the falling edge of EN.

Figure 4. First Nonzero Write Operation After Startup

control register

The control register contains ten active bits. Four bits are range select bits as on the TLC5620. The register also contains a software shutdown bit (ACT) and four shutdown inhibit bits (SIA, SIB, SIC, SID). The shutdown inhibit bits act on each DAC (DACA through DACD). The mode select bit is used to change between single and double buffered modes. The bits in the control register are listed in Table 2.

Table 2. Control Register Bits

BIT	FUNCTION
MODE	Selection bit for type of interface (see data interface section)
RNG A	Range select bit for DACA, 0 = $\times 1$, 1 = $\times 2$
RNG B	Range select bit for DACB, 0 = $\times 1$, 1 = $\times 2$
RNG C	Range select bit for DACC, 0 = $\times 1$, 1 = $\times 2$
RNG D	Range select bit for DACD, 0 = $\times 1$, 1 = $\times 2$
SIA	Shutdown inhibit bit for DACA
SIB	Shutdown inhibit bit for DACB
SIC	Shutdown inhibit bit for DACC
SID	Shutdown inhibit bit for DACD
ACT	Software shutdown bit

The S_{ix} bits inhibit the actions of the shutdown bits as shown in Table 3. When the ACT bit is 1 or the HWACT signal is high (active), the inhibit bits act as enable bits in inverse logic terms. The ACT software shutdown bit and HWACT (asynchronously acting hardware terminal) are logically ORed together.

This configuration allows any combination of DACs to be shut down to save power.

Table 3. Shutdown Inhibit Bits and HWACT Signal

S _{ix}	ACT	HWACT	DAC _x STATUS
0	0	L	Shutdown (see Note 1)
0	0	H	Shutdown
0	1	L	Shutdown
0	1	H	Active (see Note 1)
1	0	L	Active
1	0	H	Active
1	1	L	Active
1	1	H	Active

NOTE 1: Sense of HWACT terminal and ACT bit were changed from early versions of this specification.

The values of the input address select bits, A0 and A1, and the updated DAC are listed in Table 4.

Table 4. Serial Input Decode

INPUT ADDRESS SELECT BITS		DAC UPDATED
A1	A0	
0	0	DACA
0	1	DACB
1	0	DACC
1	1	DACD

SLAS138B – APRIL 1996 – REVISED FEBRUARY 1997

power-on reset

Power-on reset circuitry is available on the TLV5621I. The threshold to trigger a power-on reset is 1.95 V typical (1.4 V min and 2.5 V max). For a power-on reset, all DACs are shut down. The control register bit values and states after a power-on reset are listed in Table 5.

Table 5. Control Register Bit Values and States After Power-On Reset

BIT	VALUE	STATE AFTER POWER-ON RESET
MODE	0	Double buffer mode selected
RNG A	1	Range $\times 2$
RNG B	1	Range $\times 2$
RNG C	1	Range $\times 2$
RNG D	1	Range $\times 2$
SIA	0	Shutdown affects DACA according to ACT state
SIB	0	Shutdown affects DACB according to ACT state
SIC	0	Shutdown affects DACC according to ACT state
SID	0	Shutdown affects DACD according to ACT state
ACT	0	DACs in shutdown state

linearity, offset, and gain error using single-end supplies

When an amplifier is operated from a single supply, the voltage offset can still be either positive or negative. With a positive offset, the output voltage changes on the first code change. With a negative offset the output voltage may not change with the first code depending on the magnitude of the offset voltage.

The output amplifier attempts to drive the output to a negative voltage. However, because the most negative supply rail is ground, the output cannot drive below ground and clamps the output at 0 V.

The output voltage then remains at zero until the input code value produces a sufficient positive output voltage to overcome the negative offset voltage, resulting in the transfer function shown in Figure 5.

Figure 5. Effect of Negative Offset (Single Supply)

This offset error, not the linearity error, produces this breakpoint. The transfer function would have followed the dotted line if the output buffer could drive below the ground rail.

For a DAC, linearity is measured between zero-input code (all inputs 0) and full-scale code (all inputs 1) after offset and full scale are adjusted out or accounted for in some way. However, single supply operation does not allow for adjustment when the offset is negative due to the breakpoint in the transfer function. So the linearity is measured between full-scale code and the lowest code that produces a positive output voltage. The code is calculated from the maximum specification for the negative offset.

	Zero-scale error temperature coefficient	$V_{ref} = 1.25\text{ V}$, $\times 2$ gain, See Note 8		10		$\mu\text{V}/^\circ\text{C}$
	Zero-scale error supply rejection			2		mV/V
E_{FS}	Full-scale error	$V_{ref} = 1.25\text{ V}$, $\times 2$ gain, See Note 9			± 60	mV
	Full-scale error temperature coefficient	$V_{ref} = 1.25\text{ V}$, $\times 2$ gain, See Note 10		± 25		$\mu\text{V}/^\circ\text{C}$
	Full-scale error supply rejection			2		mV/V
PSRR	Power-supply sensitivity	See Notes 11 and 12		0.5		mV/V
	Feedback resistor network resistance			168		k Ω

- NOTES: 4. This is measured with no load (open circuit output), $V_{ref} = 1.25\text{ V}$, range = $\times 2$.
5. Integral nonlinearity (INL) is the maximum deviation of the output from the line between zero and full scale (excluding the effects of zero code and full-scale errors).
6. Differential nonlinearity (DNL) is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.
7. Zero-scale error is the deviation from zero voltage output when the digital input code is zero.
8. Zero-scale error temperature coefficient is given by: $ZSETC = [ZSE(T_{max}) - ZSE(T_{min})]/V_{ref} \times 10^6/(T_{max} - T_{min})$.
9. Full-scale error is the deviation from the ideal full-scale output ($V_{ref} - 1\text{ LSB}$) with an output load of $10\text{ k}\Omega$.
10. Full-scale temperature coefficient is given by: $FSETC = [FSE(T_{max}) - FSE(T_{min})]/V_{ref} \times 10^6/(T_{max} - T_{min})$.
11. Zero-scale error rejection ratio (ZSE-RR) is measured by varying the V_{DD} voltage from 4.5 V to 5.5 V dc and measuring the effect of this signal on the zero-code output voltage.
12. Full-scale error rejection ratio (FSE-RR) is measured by varying the V_{DD} voltage from 3 V to 3.6 V dc and measuring the effect of this signal on the full-scale output voltage.
13. Linearity is only specified for DAC codes 1 through 255.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC SMALL OUTLINE

4211283-3/E 08/12

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
